---

Dear Hiring Team,

I have spent the last decade quietly obsessed with one thing: making backend systems that people can trust. The work I am proudest of is the kind that never makes the news — a routing service that stays fast under load, a pager that stays silent through a holiday weekend.

Atlas Freight draws me because routing and tracking millions of shipments is exactly the problem I have lived inside. At Northstar Logistics I led the redesign of our order-routing service, cutting p99 latency from 1.2s to 280ms and holding it there through a 3x traffic increase. I re-architected that routing model around event sourcing, which eliminated a class of double-assignment bugs that had been causing customer-facing incidents every quarter. And I built a Kafka-based event backbone for shipment state changes that decoupled six services and gave customers near-real-time tracking. Owning services end to end, in Go and Python on cloud platforms, is simply how I work.

I also believe reliability and observability are first-class features, not afterthoughts. I introduced a service-level observability standard — structured logs, RED metrics, trace propagation — that six teams adopted as their onboarding template, and I rebuilt our on-call tooling and runbooks to cut pages per week by 40% and mean time to acknowledge from 12 minutes to under 4. Reducing on-call burden across teams is a problem I genuinely enjoy.

I write clearly, I mentor generously, and I measure what I ship. Two of the engineers I mentored were promoted to senior within 18 months, and I have a habit of turning hard-won lessons into guides others can use. I would welcome the chance to bring that same pragmatism to your shipping systems.

Warmly,

**Jane**
